## ABSTRACT

2        A machine for manufacturing a capital for an architectural column. The machine has a  
3 shaft with a releasable connector for attaching a mold for an architectural column to the shaft.  
4 Traditional means are employed to produce rotation of the shaft. Rotation of the shaft occurs in  
5 multiple axes, preferably two substantially orthogonal axes. These are preferably the pitch and  
6 roll axes. Rotation in more than two axes is, however, also contemplated. Also preferably, the  
7 shaft extends substantially symmetrically about the point of rotation for the first axis.
